CLIMAT

- ▶ Climate change in the world can be caused by various activities. When climate change occurs; temperatures can increase a dramatically. When temperature rises, many different changes can occur on Earth.
- ▶ For example, it can result in more floods, droughts, or intense rain.

- ▶ Oceans are warming and becoming more acidic, glaciers are melting, and sea levels are rising. As these changes frequently occur in future decades, they will likely present challenges to our society and environment.

- ▶ During the past century, human activities have released large amounts of carbon dioxide and other greenhouse gases into the atmosphere

- ▶ However, while greenhouse gases buildup, the climate changes and result in dangerous effects to human health and ecosystems.
- ▶ For example, carbon dioxide can stay in the atmosphere for nearly a century, so Earth will continue to warm in the future.

- ▶ Global warming has really taken effect in the world over the last century. A warmer climate can bring changes that can affect our water supplies, agriculture, power and transportation systems, the natural environment, and even our own health and safety.

- ▶ The rising of temperature will have great effects on the earth's climate patterns and on all living things. We need to take part and try to stop global warming and other effects on climate change.

- ▶ If everybody as one take stand and try to end most of the climate changes that are occurring, this world would be a safer place to live on.
